Subject: Importing data to iTool Data manager from the command line

---

I am trying to use iPlot for analysis of some data and would like to import a whole bunch of data to the Data Manager from the IDL session.

Then I would switch to the data manager and generate some plots.

The IPLOT command is not what I want. I do not want a plot. I want first to pass 7-10 columns of data, and only then switch to the iTool to figure out what to plot and where.

I could not find anything explicit in the documentation. Maybe in the iTool Development Guide, but I am still trying to figure that one out.

In the meantime, has anyone got a clue on how to accomplish this?

Thanks,

Mirko
