Subject: 32bit to 64bit conversion

Hi all,

I have data in the form big endian 32 bit positive integer (31 bit data with extra most significant bit set to zero). I want to import this data into idl 5.5 running on a sunblade 64 bit Unix machine.

The IDL code (written for 32 bit PC) seems to work fine if the data is positive but the negative values are not coming out right.

Please help.

Thanks,

Tapuosi
