
Subject: tree widget sizing

Hi,

I am using WIDGET_TREE in an application where the leaves represent data sets. The labels (VALUES) for the leaf widgets are the filenames (minus the path) and can vary in length at runtime. So setting a fixed width for the tree widget is not a good solution to the problem of viewing the whole label (which is what I want to do). Since the tree widget does not have a DYNAMIC_RESIZE keyword like the button widgets I'm not sure how to resize the tree widget at runtime. Does anyone have any good ideas on how to dynamically change the tree widget size so that the user can see the entire leaf label? My only idea is a hack in which I destroy the widget and create it again with a new width (mapping and unmapping the base accordingly)...ugh...!

Thanks,

Rob
