Subject: IDL function randperm?

## Greetings!

I wonder if any of you have an IDL function that gives a random permutation of an array index, or know of a straightforward way to compute it?

In Matlab such a function is called "randperm(n)" where n is the length of the array.

For example, if one gives the integer 8, then it returns a length 8 integer array with values 0 to 7, randomly permutated.

It is not as simple as it sounds, since the indices are unique. I tried variations of randomly SHIFT'g indices from INDGEN() with a random number generator, and the values were not 'jumbled' satisfactorily.
