I need to plot a lot of cumulative distribution functions (CDFs) with data we've collected (you know, probability on the y-axis, value on the x-axis. The problem is they need to be gaussian-distributed (among other things, the y-axis values are logarithmically distributed, i.e. from 1E-3 on the bottom to 1-(1E-3) on top). Does anyone have any IDL code that does this? I need it urgently. Please E-mail to nanis@ll.mit.edu.
Thanks.
