Hi,
I just tried to install IDL 6.0 (had 5.6 also installed). But unfortunately i have problems with the FlexLM stuff. When i installed 5.6 i thought that i have to install this flexlm to use my license file. But after installing 6.0 i have only error messages like "feature not supported: idl" or after i deinstalled 5.6 and reinstalled 6.0 i got "the desired daemon is down" vendor host: {my machine name}.

I found no possibility to get rid of the flexlm or do i need it?

does anyone have a clue for this?

Kay
