Supposing I have a big array and I also have an array containing indices of unwanted elements. Is there a neat way of removing those elements from the array?

Attempts using WHERE() have failed for me* and currently I'm looping through the array of indices and deleting them one at a time - which is fine when I've only got 20 or 30 of them but I doubt it'll scale well.

* - I tried to make a list of indices that I wanted to keep using WHERE(indgen(x) ne unwanted) but that only produces the first n_elements(unwanted) of the correct indices.
