Hello,
    I am new to IDL and have just written my first object graphics application. Whilst testing for portability on UNIX I have found that text labels on the z-axis disappear when rotating a surface plot with the trackball object.
    Thus far I have found no conventional reason for this. Has anyone had a similar problem, if so your help would be greatly appreciated.

              Thanks, Dan Bird.
