I am just starting to use widgets and I'm having a lot of trouble with the IDL hanging; I have to use a ctrl-z to stop the process. I suspect that most of the problem was caused by my using a Draw widget and the mouse generating thousands of events in that window. I have now switched over to using a regular window for my graphics and just using widgets for buttons and sliders.

Is this a common problem and is there any reason to use a Draw widget rather than a regular window? Even now ISL hangs occasionally; I think it is usually when I move my mouse over another widget immediately after selecting one.

I am running IDL v2.3.0 under IRIX 4.4.
