Hello All,

FYI.

A colleague running IDL 6.0 under Linux found that Dialog_Pickfile crashed with a Floating Exception error.

The immediate culprit was an entry in his xDefaults file :-

*highlightThickness: 0

Removing that entry, or setting it to 1, prevented the crash.

Note that IDL v5.6, installed on the same machine alongside 6.0, has no trouble at all with setting *highlightThickness to 0.

Obscure, yes, and probably unlikely that anyone else on the planet will trip over it.

Which is probably why RSI told _us_ to go approach the Motif people...

Andrew
