Sorry, Mac guys. Maybe my title is somewhat misleading here. This is because I thought it's hard to compare between different hardware configurations. That is also why I am a bit exciting when I found a multiboot P4. Of course you guys are welcome to talk about your experiences over different platforms. Remember there're Solaris/HP-UX/IRIX/AIX users.;-)

Anyway, any story about performance testing related to idl is highly encouraged.^!^

Cheers,
Yunxiang
