
Subject: Resolve iTools for Virtual Machine

Hi,

I have written a postprocessor for my code, which is handling the browsing through the data set and display them.

Before I had two inconveniences:

- 1) I had to write a lot to make the postprocessor user friendly (changing color, labels etc.)
- 2) Users of my code had to pay for IDL although they are just using my postprocessor.

With the arrival of IDL 6 and the features of iTool and Virtual Machine I thought my problems are solved, but so far I couldn't create a working ".sav" file. The problem is that itools use some runtime dependencies, which cannot be resolved with the `resolve_all` command.

Any idea how this can be solved or is it better to drop itools and write a "mytool" version?

Thanks
Svne Reiche
