
Subject: IDL crashes

Hi,

I am running IDL 5.4 in Win XP and it crashes more than half of the times while running (different) programs. This only happens on my machine and not in others with the same configuration and running the same routines. The message I get is:

"IDL for Windows Integrated Development Environment has encountered a problem and needs to close...."

then if I click in Debug I get:

"Unhandled exception in idlde.ex (IDL32.DLL): 0xC00000005: Access Violation"

and there are many hex numbers and stuff if one click on "Technical information" that I would be happy to share with someone who's interested...

I have tried reinstalling IDL, I also installed the version 6.0 in demo mode. Everything! But the crashes are still there. Any ideas?? Reinstall windows? Remove all the other software? Change the RAM? (I have 512Mb by the way)

Any help would be appreciated!

Luciano.
