Subject: how to add a menu item for printing a variable when debugging
Posted by julia65201 on Wed, 12 Nov 2003 19:11:16 GMT

Hi, there,

As I remember, in previous version of IDL, I can do this:

Set a breakpoint, run the program. When the program stops at the
breakpoint, highlight a variable, then choose a menu item, "print
varialbe", the highlighted variable will be printed out.

However, I can not find such menu item in the IDL 5.6. If I want to
print a variable when debugging, I can only input "print **" in the
command line.

So my question is:
How to add a menu item for printing a variable when debugging like we
can did in IDL 5.4?
I suppose "MACRO" can do this.

Could anyone give me a hint how to do this? Thanks!
