Has any one yet tried out Fedora Core 1 (RedHat 10's new name) Linux with IDL? I was wondering if it worked. What is RSI going to do with their Linux versions? Are they going to switch to testing with another linux distribution, or test with the expensive RedHat Enterprise versions, or with the new Fedora versions? I am thinking of upgrading from RedHat 7.3 and RedHat somewhat dropping support for the free versions have me wondering what I should do?

Paul
