If you do a "Help, filter" after the DIGITAL\_FILTER step,  
you see that the filter is a 21-element 1D array. So  
the convolution is performed as in 1 above.

You can also see this because there will be black  
bands on the left and right edge of the image, since  
the example did not use the EDGE\_TRUNCATE keyword.  
Had the filter been applied two-dimensionally, you  
would have seen a band around the entire image.

Cheers,

David
