RSI has just sent out the following announcement:

RSI has completed testing of IDL 6.0, ENVI 4.0, and the IDL Virtual Machine
on Mac OS X 10.3 (Panther).

We recommend IDL users who have not already upgraded to this version of the
operating system do so as soon as possible, as it addresses the Apple bug we
alerted users to in October that has the potential to cause in-memory data
corruption (http://www.rsinc.com/services/techtip.asp?wid=4333&ttid= 3580).

Panther also contains the first official release of the Apple X11 Window
System for running X11-based applications on the Mac.

You can find out more about Panther by visiting the Apple Web site at
http://www.apple.com/macosx/.

Now for my question - I've heard some horror stories about problems
installing Panther on existing systems. Has anyone out there upgraded from
10.2 to 10.3 on a PowerBook G4? Any problems with the upgrade or with IDL?

Thanks very much.
