Hello All,
   I am running IDL 5.5 on Debian Linux system (Kernel 2.4.22-1-686)
and when I have a display window, moving the mouse over the IDL
display window makes the entire screen change colours.
   These are the first few lines of the programme which call the
colour table:

```
  device, decomposed = 0, retain = 2
  loadct, 13
  ...
  tvscl,array
```

IDL> device,get_visual_depth=a
IDL> print,a
       24

Thanks,
KB.
