```

You haven't realized the draw widget. The draw widget doesn't
have a (valid) value until after it has been realized.

```

I'm not exactly use what you are asking for here. I presume
you are asking for what directory is the current directory.
(The IDLDE is always called from the same directory, "bin" something.)
You find the current directory in IDL like this:

```
IDL> CD, Current=currentDirectory & Print, currentDirectory
```

Because this involves too much typing, you usually put this
into a PWD procedure:

```
PRO PWD  
  CD, Current=currentDirectory & Print, currentDirectory  
END
```

Then, to learn the current directory, you just type:

```
IDL> pwd
```

Cheers,

David
