Hi,

Is it possible to determine all of the top-level base ids of applications running whose group leader is the only id "known"? That is, can a function be written such that

```
tlb_ids = GET_ALL_TLB_IDS(group_leader_id)
```

where the return value, tlb_ids, is (possibly) a long array of widget ids each of which have group_leader_id set as their group leaders? (Perhaps I missed some simple keyword to WIDGET_INFO?)

Thanks,

Rob
