
Subject: IDL6 on FreeBSD5.2?

I'm playing with my newly installed FreeBSD5.2 box these days. I am wondering if anybody knows how to run the idl6 on it. I remember I had read some successful stories about running idl5.2 on a FreeBSD system. When I tried it today, I can only get the idl/idlde startup but can't call any functions. How do I know which lib file is missing and where should I put it? Do I need to brand the binaries? Thanks!!!

Regards,
Yunxiang
