Subject: PRINT needs minor improvement

---

When debugging code, one prints variables as the code runs to check their values. I sometimes make typos, such as  
PRINT, 'energy = ', enegry

The PRINT command crashes the entire code, complaining that enegry is an undefined variable. It would be a nice improvement if, in this case, PRINT acts like HELP, and just says  
ENERGY UNDEFINED = <Undefined>  
and the code just continues on...
