Hi.

I'm using the function dialog_write_image in an application that is supposed
to run in virtual machine. But it happens a strange thing. Since this dialog
box has many option, as try to write in bmp, srf or ppm it gives an error
message saying that it couldn't find the functions wite_bmp, write_srf and
write_ppm. And if I do the same running in idlde (i.e. with the license) I
get no error, he finds the functions.

Anyone have an idea for what's going one? Anyone had the same problem? Or
this is a case for Super-Rsi?

Cheers,

Nuno.
