Hello all!

I am trying to use IDL to deal with a large number of .TIF images. The images belong to different classes, and that information is useful to me. Currently, i have stored the images in different folders to mark which class they belong to, but i would like to store that information in the TIF header and then read it in my program. The information is simple text such as 'class A', 'class B' or just A, B, C..etc. Does anyone know how this might be accomplished?
