
Subject: Displaying Programs

Hello Again,

I've got a large group of procedures and functions which I inherited from a collaborator - about 20-30 which share various common blocks (yuck!) and rely on each other to operate a data compression and analysis algorithm. For a couple of years I've added to it and modified it, but I'm starting to loose track of where everything is and what everything does.

I'd really like to be able to make some sort of diagram out of the code, which highlights what depends on what, which programs are exposed to which common blocks and what each procedure does for a quick reference.

At the moment I'm doing this with a pen and a large sheet of paper, but it ocured to me that all the information I am trying to put down is already in the headers [they're in the standard(?) format followed by astrolib and coyote].

Does anyone know of an automated method for a) extracting this data and b) displaying it?

I know I should have done this *much* earlier, but then, there's a lot you learn over the course of a phd!!!

Cheers,

Ben
