Hi,
anybody knows which part of code at 'xvolume' example makes a volume to a wire surface.

At 'xvolume' you can pass a 3D data and it represents in the screen with possibility to rotate, scale and so on. I have been seeing the code of xvolume and some classes it use (IDLexVolview, IDLexObjview, ...) but i can find wich part of code makes the "conversion" from volume to a "wired volume".

Thanks
:)
