Hello together,

I want to create own symbols for the plots with the usersym-command.

When I want to create a square to plot, I have to know the ratio between x- and y-axis, when it is not isotropic.

Is there a way to get this ratio or do I have to specify this plot for example with the position keyword and get the ratio from the values for this keyword and the size of the page ?

Thanks for your help in advance !

Klemens
