Subject: Widgets in VM

Hi all,
I recently started using VM and it gives me a bit of headache... I
have a .prj with one application which creates a main widget and when
certain buttons are pressed it launches secondary widgets which get
the info from the user and return back to the program flow. In proper
IDL environment it runs perfectly.
(I am not using /NO_BLOCK or /MODAL in XMANAGER.) When I run the .sav
version and a secondary widget is launched, after its destruction, it
does not return back to the program to process the new info, it just
stops until I launch again the same widget, only then goes back but of
course it also re-launches the widget.
If the above are not very confusing and anybody out there knows the
reason, I would appreciate to tell be what I am doing wrong.
Many thanks,
Antonis
