Some of my collegues have just started using eXodus on there
spanking new 7100 PowerPCs.

IDL initialises (pseudocolor=8) with 224 cols,
(!d.colors=!d.table_size=224) which is normal for OpenWindows.
But the color tables are strange.   For example, Xloadct color
tables are strangely banded:  CT 0 (black-white) has 16 equal
bands but some of the others have more bands but with non-uniform
widths.

Anyone know about this?

Thanks

Fergus
