
Subject: Assigning names to views and plots in iplot

As I was afraid, I am on the path of using itools to manage my data and not just plot it. In plots with multiple views, I find myself renaming views and plots to more meaningful names than view_1,2,3, and plot_1,2,3.

Has anyone figured out a way of naming a view and a plot from the program line?

On a side note, I discovered that although the data-manager has the facility to rename the data, the names are lost after a save/read cycle. Bummer.

BTW, it would be great for iTools to have a comment field somewhere, where one might add some notes as to the origin of the data, or whatever.

Thanks,

Mirko
