Since the call works for you when run as a stand-alone application, take
a look at all of your environmental variables (you can do this with the
'env' command). Take any of them that deal with IDL (e.g. \$IDL_DIR,
\$IDL_PATH) and include them in your script.

Another thing you might try is to set the environmental variables
regarding the location of RSI in the tomcat startup script itself. That
shouldn't really make a difference, but you never know.
