
Subject: selfcreating filenames for putput files?

hi there,

I created a pro with which I can compute a list of different images. As a result of the computation I want to save the results in a File, which's name should consist of the name of the input-file and a suffix indicating which result it is. File is a variable which contains already the filename of the input-file.

like:

write_tiff, file and "_1st_PC.tif", computed_image, ORIENTATION=2

How can I connect the changing variable file with the constant suffix "_1st_PC.tif" ?

Thank you very much!
Tom
