Yes. This is called "callable IDL" (C interface). I haven't ever tried it (I usually go IDL->C :) so I can't comment on it. IDL also ships the IDL ActiveX control which would allow you to do this in windows. Again, I haven't used it.

I'm sure that if you contact RSI they could at least supply you with the external development guide where callable IDL and the IDL ActiveX control are documented. Better yet, they should be able to provide you with a temporary license so you can try it and see.
