Those of you using PV-WAVE versions 2.x or 3.0 under SunOS 4.1 & OpenWindows version 2 may have noticed an annoying "feature": the default color map that PV-WAVE uses causes the Sun colormap to be set to all-white upon exiting from OpenWindows. This means that one can't see what one is typing. The condition is not reset by logging in or out; only explicitly resetting the colormap (by re-entering OpenWindows, for example), or implicitly resetting it (by rebooting) will fix the problem.

It seems that responsibility for this problem lies both with PV-WAVE, for leaving a "bad" colormap on exit, and Sun, for not resetting the color map upon exiting OpenWindows. PV-WAVE was not helpful in finding a fix for this problem, but Sun pointed out the utility `/usr/bin/clear_colormap`, which resets the colormap to the Sun defaults.

The workaround, then, is to invoke `/usr/bin/clear_colormap` just before the `exit(0)` call of `/usr/bin/openwin` (the OpenWindows startup shell script). This resets the colormap after the X server has already exited.
