Subject: interpol over huge cube

Hello. I need to execute the interpol command over a huge cube of data...ie on 1000's of the individual columns making up the cube. I have carried out a WHERE statement giving me the x-y indices of all the columns I need to run the interpol command on. However, I do not want to use an "evil" FOR loop to go through column by column in order to pull out a column-vector of data to work with. I would much rather run INTERPOL on the whole cube if possible. The problem is in order to get the argument specifics for the INTERPOL command I need to carry out a few more WHERE statements on the individual columns (at least this is the only way I've come up with so far). Any suggestions??

-Dan
