Subject: 2d where

Posted by GrahamWilsonCA on Tue, 13 Apr 2004 16:30:28 GMT

I have read through the IDL documentation and while it does explain
why the following doesn't work, it doesn't offer any alternatives :(

I am trying to find the indexes where the elements of 'bar' are equal
to 'foo'.

```
IDL> foo = ["a", "b", "c", "d", "e", "f"]
IDL> bar = ["b", "e"]
IDL> print, where(foo eq bar)
      -1
PERFECTDL> print, where(foo eq bar)
      1   4
```

Any ideas?

Graham
