I have seen behavior from SPAWN that may or may not have anything to do with your problem. (I am now running IDL3.6.1a under Solaris2.3)

I was doing something like:

```
SPAWN,'ls *.dat', filelist
print,filelist
```

This would look fine on the screen, but then I would try:

```
openr,lun,/get,filelist(0)
```

and I would get a message saying file not found. A clue to the problem was revealed by:

```
print,strlen(filelist)
```

filelist(0) was much longer than any of filelist(1:*). The problem was due to the initialization of my shell that was created by SPAWN.

I had some non-printing characters that were used to set the title of my X window etc. and these were being returned as the start of the result returned to SPAWN in the variable filelist.

The proper solution would have been to make my shell start-up smart enough to recognize that it was not running in an X window. The quick solution (which is what I implemented) is to intercept the undesired characters thus:

```
SPAWN,'date ; ls *.dat',filelist
filelist=filelist(1:*)
```

For other applications where I did not need the shell (for example when I did not have any wildcards in my command), then SPAWN,/noshell would also work.

I first experienced the problem after upgrading the OS and/or the version of IDL, but I have forgotten the specifics-- it was over a year ago.

good luck,
