Subject: widget_table: width of row label column
Posted by Benjamin Hornberger on Thu, 06 May 2004 17:19:53 GMT

Hi all,

all the postings about that question I found so far were not answered
unfortunately: Is there a way to control the width of the column which
holds the row labels in widget_table? In Windows, IDL seems to size that
column appropriately so that the labels just fit. In Linux, it makes
them too small, the text is cut off. Using the column_width keyword only
changes the width of the data columns, not the label columns.

Thanks for your help,
Benjamin
