Subject: READ_ASCII - accessing data from structures
Posted by m.doyle on Wed, 12 May 2004 17:14:05 GMT

Hello all,

I wonder if anyone might be able to help me with this?

I'm using the IDL READ_ASCII function to read in a semicolon seperated
file, after which I'd like to access individual elements of that data
file. From the RSI website, I see that I can access the data fields
(i.e. each column of data) by using, for example;

print, mydata.(4)

using the Variable_Name.(Tag_Index) method.

Could someone tell me how to get to the individual elements of
mydata.(4)?? Using the above I can only get a large stream of numbers,
I need to use them one by one.

Many thanks for your help!

Martin
