Hello

Can someone (David?) tell me how to get alternative labels on David's colorbar?

I wanted to ask you guys if I could avoid changing his program.

Here is my code:

```
print, names
help, names

colorbar, /vertical, $
    Position = col_pos, $
    Range=[0,r_levels(n_elements(r_levels)-1)], $
    NColors=n_elements(r_levels)-1, $
    Bottom=101, $
    Color=!P.color, $
    Divisions=n_elements(r_levels)-1,$
    /right, $
    TITLE='mm/3klst',$
    ytickname=names,$
    format='(A2)'
```

And here is the resault from the print/help functions:

```
    0    1    2    3    4    5    10
15    20
NAMES      STRING  = Array[9]
```

Isn't the `_EXTRA` keyword supposed to pass ytickname to the `AXIS` procedure? And it it doesn't matter if names are a integer array and `format='(I2)'`

best reg.
Einar
