Subject: Intermittent unexplained crashes
Posted by geoff.budgell on Fri, 28 May 2004 09:32:29 GMT

Any ideas as to the source of my problem:

I'm running IDL 6.0 under Windows XP (but still get the problem when I
tried it on Windows 2000).

I'm running an IDL project which intermittently crashes out (kills
IDL) just after jumping into a particular procedure. It happens at
either one of two points in the program and is intermittent so doesn't
appear to be directly related to the code. It happens using several
different computers. I've tried loading IDL locally rather than
running over the network and turning my virus checker off, but all to
no avail.

Has anyone seen similar problems - any clues as to what might be the
cause?

Many thanks for any help.
