This is in regards to "Re: Surface Problem" (The server won't seem to let me respond to the thread, and won't allow me to put "Re:" is my subject unless I am responding to a thread. Anyway,

Thanks guys. Anyway, my data is not regularly spaced. I have data at 8 different radii, varying from about 25 to 71, and 24 different angles, from 10 degrees to 350 degrees. These values are not evenly spaced, but are related to the geometry of our measuring device. Does this then affect how I would create a first surface?

Thanks,

Jeff
