
Subject: Reading unformatted data from exabyte tape

I'm trying to find a way to read unformatted data from an exabyte tape using readu. The problem is the data is structured with a lonarr header of 50 words followed by a data array (fltarr of 6620 words). I can read each record successfully if I only read the header or the data alone (ie lonarr(6670) or fltarr(6670). I hope there is a way that I can read both in the same record in IDL. Any suggestions?
