hi,

The function I am trying to integrate is :

$$F(x) = a \cdot \exp(-b \cdot (x^2))$$

where: a and b are parameters

x ranges from 0,20

We have experimental data to fit with the above integral (a and b as parameters to be found from fit).

When I tried to integrate the above mentioned function with QROMB we get a single value as the answer. I cannot fit this value to my data.

Can anybody please help me to get the F(x) value for each value of X.

Thanks.
