Is there any possibility to draw a rectangular grid (with typically 30x40 grid cells in XxY direction) on a standard UTM map in idl? What I'm looking for is a standard plot presenting numerical model results with the grid cells coloured according to the values. The map itself is easy enough to make but when overplotting squares with fixed distance (in meters) the grid lines get "zig-zaged" when converted to lat/lon. Do I e.g. have to split the grid lines into an extremely dense row of UTM coordinates and then convert to lat/lon? A bit awkward. As far as I know, idl hasn't any functionality for UTM map coordinates, or am I wrong?
