Hi,

I just watched the "What's New in 6.1" presentation on RSI's site. It was done ok, but the sound really sucked and they require an install of WebEx. Anyway, I was told by RSI back on the "What's New in 6.0 World Tour" thingie, that 6.1 would have HDF5 WRITE support... which it doesn't. According to one slide on the W.N.I.6.1 presentation, they said HDF5 write support would be available soon. My questions are how soon and in what form, a patch for 6.1 or wait until 6.2??? Any time tables RSI?

Except for this small point 6.1 seems to be great. I really like not having to install VM to run .sav's and the alpha channel on the surface and polygon objects rock!!!

Have fun,
dave
