Subject: learning to animate Posted by imcscastel on Thu, 26 Aug 2004 23:56:19 GMT View Forum Message <> Reply to Message

Hi,

I am trying to animate some x-ray images of a spine cord. I would like to hear some advice about how to load in a loop all the images, so that they can be animated in the same xinteranimate widget. I have tried several ways but the error message of "one animation at a time" keeps poping up! Is it necessary to open a window per image? I have a *bunch*, so this is kind of cumbersome...

Any advice will be kindly appreciated.

Regards, Imit
