
Subject: Capitalising Standard, functions and routines

Hi,

I've just migrating to using emacs to write pvwave code, does anyone know if you can get emacs or idlwave to automatically recognise the standard functions and routines in pv wave and set them to uppercase. Basically in a similar fashion to the setting reserved words (FOR, IF etc.) to uppercase. I can only figure out how to do it if you complete the routine/function, though I don't want to have to do a completion every time I want to call a routine/function.

Also I'm running on kde on red-hat linux but M-tab to complete changes the desktop rather than a completion, so I'm having to using the toolbar. Does anyone know the best way to avoid this. Do I have to change what kde uses to change the desktop, or change what emacs uses for a completion instead of M-tab? which would be easier and how wo I go about doing it?

Thanks for any help

Regards

Ricky
