
Subject: How to prevent graphics window getting focus in VMS V6.1?

Greetings:

We recently upgraded to OpenVMS v6.1 (Decwindows-Motif v1.2). My IDL graphics windows now get input focus, where previously they did not. If I open a graphics window, move it, or click on it, it gets keyboard focus. This gets irritating since I then have to click in the terminal window to obtain focus and then do a wshow to pop the graphics window over the terminal window.

In the previous version of VMS, I could prevent the IDL graphics windows from getting focus by having the following in my decw\$defaults.dat file :

```
Mwm*enforceKeyFocus: false
```

This does not appear to work anymore. Changing it to true doesn't do anything either.

Does anyone have a fix for this problem? Respond here so that others may find out.

Thanks,
John Krist
