This morning I found a workaround. Not very nice, but it works:

In the license/Imgrd.opt file I excluded the users, which run the Virtual Machine: GROUP PROCESSES abcd efgh **EXCLUDE idl GROUP PROCESSES** 

Nevertheless the behaviour (feature) of the license manager is guite nasty:

As long as it can get a license from the pool, it takes it. If not, it looks for other possibilities. On my notebook IDL runs under a 'personal use' license, but if the notebook is connected to our network, it occupies a license from the pool.

Any other ideas?

Hermann
